

The Monthly Security Awareness Newsletter for You

Overview

Making the most of technology safely and securely can seem overwhelming and confusing. However, regardless of what technology you are using or how you are using it, here are four simple steps that will help you stay secure.

1. You: First and foremost, technology alone cannot fully protect you; you are your best defense. Attackers have learned that the easiest way to get what they want is to target you rather than your computer or other devices. If they want your password, credit card, or control of your computer, they'll attempt to trick you into giving it to them, often by creating a sense of urgency. For example, they might call you pretending to be Microsoft tech support and claim that your computer is infected, when in reality they are just cyber criminals who want you to give them access to your computer. Or perhaps they send you an email warning that your package could not be delivered and you need to visit a website to resolve the issue, when in reality they are just trying to trick you into visiting a malicious website that will hack into your computer. Ultimately, the greatest defense against attackers is you. By using common sense, you can spot and stop many attacks.

2. Passphrases: Modern computing speeds have made the old, eight-character password outdated and vulnerable. When a site asks you to create a password, create a strong and unique passphrase instead. A passphrase is a type of password that uses a series of words that is easy to remember, such as "bee honey bourbon rain". Create a unique passphrase for each device or online account. This way, if one passphrase is compromised, all of your other accounts and devices are still safe. Can't remember all those passphrases? Use a password manager, which is a specialized application (such as LastPass or 1Password) that stores and manages your passwords for you (as well).

your online accounts, and it's much easier than you may think.

3. Updating: Make sure each of your computers, mobile devices, programs, and apps is running the latest version of its software. Cyber attackers are constantly looking for new vulnerabilities in the software your devices use. When they discover vulnerabilities, they use special programs to exploit them and hack into the devices you are using. Meanwhile, the companies that created the software for these devices are hard at

these updates promptly, you make it much harder for someone to hack you. To stay current, simply enable automatic updating whenever possible. This rule applies to almost any technology connected to a network, including internet-connected TVs, baby monitors, security cameras, home routers, gaming consoles, and even your car.

4. Backups and recovery: No matter how careful you are, you still may be hacked. If that is the case, often the only way to restore all of your personal information is from backup. Make sure you make regular backups of any important information and verify that you can restore your data from them. Most operating systems and mobile devices support automatic backups, either to external drives or to the cloud.
